Blocking Thames River Would Close Busy Port

Any attempt to close the mouth of the Thames river with mines and sunken ships would, if effective, close to shipping one of the world's busiest rivers. For London is the second largest port in the world, annually receiving shipments from nearly 30,000 vessels.

About 180 miles long, the Thames at its mouth is more than five miles wide. It is about 750 feet wide at London.

Daily, 500 vessels pass through the mouth of the Thames. The port of London receives and ships over its 1,700 wharves goods valued in excess of $3,500,000,000 a year. It has 700 acres of enclosed dock water, and five miles of quays. The docks extend 25 miles below the city. In the era of the sail, even without dredging, the largest seagoing vessels could sail almost up the Thames to the London wharves.

For centuries, the Thames with its many tributaries has furnished power for English mills and industry, according to the National Geographic society. Huge hammers weighing two, three and four hundred pounds were powered by water, as were the great metal cutters and the roaring bellows behind blast furnaces and forges.

Aside from its economic importance to London and England, the river's popular appeal is in its scenery and history. It has been said that "the Thames is liquid history." Up and down the valley the tides of war have ebbed and flowed, as various forces advanced and retired, Britons and Romans, Saxons and Danes, Cavaliers and Roundheads.

It also has been called the stream of pleasure, where London holiday throngs witness boat races and join boating and fishing parties. Its banks lure bicyclists, hikers and painters. When roads were fewer in England, the river was a great thoroughfare. Many old riverside taverns still extend hospitality to wayfarers.

Tigers in Japan

That tigers once roved Japan is the opinion of Hajime Uchida, zoologist of the Science Museum of Hitaya Ward, Tokyo, after completing an investigation of the contents of a chest donated to the Azuma shrine in 1199. The chest was believed to have contained the head of a lion, but Uchida pronounces the head that of a tiger. Because the articles in the chest are held secret, priests of the shrine objected to a detailed examination. The shrine holds the soul of Princess Ototachibana, consort of Prince Yamatotakeru, according to the legend. It is related that while on a ship during a tempest she leaped into the waves to appease the angry waters, sacrificing her own life, but saving that of her husband.

CHICKEN DEATHS CAN BE TRACED

Immediate Post Mortem Will Aid in Finding Disease.

By DR. F. R. BEAUDETTE

Immediate post mortem examination of all chickens and other birds that die is the only means of knowing the causes of death. Records at the New Jersey agricultural experiment station indicate that over a period of years one can learn to expect certain diseases to occur at certain seasons of the year, but occasionally a new disease appears.

In general, however, pullorum disease and bronchitis come in the spring and are followed by coccidiosis and parasite problems. In the fall paralysis, pox and the respiratory infections appear. In mid-winter the mortality goes down and the diseases are of a miscellaneous character.

Birds are subjected to diseases caused by viruses, bacteria, fungi, protozoon, nutritional deficiencies and various external and internal parasites. These diseases are as numerous and as complicated as are the diseases of other species of animal or man, and, for this reason, their solution is equally as difficult. In fact, there exists in chickens or birds a disease to parallel almost any disease in any other animal. Thus, chickens have malaria, tuberculosis, typhoid, tumors and pox, all of which are adapted to the bird. At the same time, they have a few diseases actually acquired from other animals such as swine erysipelas and tularemia.

However, chickens are the least source of infection for other animals or for man among all of the food-producing animals. Moreover, an egg from a healthy hen is bacteria-free which makes it the only food of animal origin of that nature.

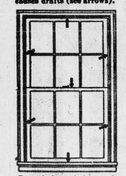
'Battle of Barberry' Wages in Mid-West

No one knows, when a new species of plant or animal is introduced from one region to another, what the result will be.

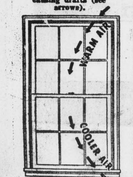
Now, in the middle western and north central states, war is being waged on a plant, introduced from New England by the earlier settlers. The barberry bush is ornamental, its seeds attract birds, and only in recent years has it been discovered that fungus causes stem rust of wheat, oats and barley.

EASIEST TIME TO CURE DRAFTS IS WHEN YOU BUILD!

Poor wall joint between window frame and wall causes drafts (see arrows).



Poor fitting window sash allow cold air to leak in causing drafts (see arrows).



A single pane of glass cools warm air quickly. Cool air drops to floor causing drafts.

WATCH THESE THREE PLACES IF YOU WOULD STOP THEM

There is just no excuse for drafts in your new home, because drafts are definitely curable if you will watch just three places—and all three places are around your windows.

First and foremost offender in the making of drafts in your new home is the window frame. Now you've never bought window frames so you don't know anything about them and that is one reason why so many home builders have drafty windows, because they were careless about the window frame that went into their homes. Now, we aren't going to go into detail about window frames. We just want you to remember that the most important thing about a window frame is how it joins the wall. If it makes a permanent leakproof weathertight joint with the wall—fine and dandy. If it doesn't, you'll have drafts, no end of drafts. How can you make sure about a weathertight joint? Just specify that the window frames used in your new home have wide blind stop construction. This special construction should be familiar to your contractor.

Proper Fitting Necessary

Next in importance to window frames is the window sash (the part of the window that moves within the frame). Many home builders buy window frames in one place and sash in another with the result that the sash and frame never fit properly in spite of trimming and cutting on the job. And sash that don't fit properly cause drafts, and more drafts. The modern trend is towards what is known as complete window units that are delivered with frame and sash precision fitted to each other at the factory. Many of these window units are even complete with weatherstrip. In any event be sure that the window sash are fitted properly to the window frame and you'll eliminate another big source of drafts.

Glass Cools Air

Now here is the third cause of drafts. It's warm air being quickly cooled against a single pane of glass. The cold air then drops to the floor. This flow of air causes drafts. What's the cure? A double pane of glass. Some windows are made so that this double pane of glass fits on the inside of the window, while the most common is the ordinary storm windows which are hung on the outside. Whether your double glass is inside or outside, the result is the same. The glass that is within the heated room is kept warmer by the dead air space between the double panes. Result: Warm air is not cooled so fast; no cool drafts. Warm

This Honey of a Small House Is a Work-Saver

What makes a GOOD house? A good house is distinguished by four qualities.

1. It should be efficiently planned. 2. It should be attractively composed. 3. It should anticipate the present and future needs of the family that will occupy it, and 4. It should be well built.

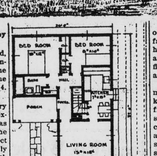
This small house—a one story house with two story privacy—exemplifies all four qualities. It was designed by Randolph Evans, the well-known small house architect and was selected by the Monthly Small House Club at 227 East 45th Street, New York, as its house of the month.

And this is why the Club believes it to be a GOOD house:

1. It is efficiently planned. Both bedrooms and bath can be reached from the entry without passing through the living room. If necessary, they can be completely shut off from the rest of the house to provide "second story privacy."

Every major room has cross ventilation—windows on two or more walls that flood the house with sunlight and air.

2. It is attractively composed. Mr. Evans has pulled out the living room wing and added an engaging bay window to give this house a sprawling impressiveness. The roof is low-pitched and covered with mineral-surfaced, thick-butt asphalt shingles. He has used a wide projecting cornice to give a deep shadow line at the eaves, and added a husky chimney with none of the spindly characteristics of many small house chimneys.



FIRST-FLOOR PLAN

3. It anticipates the needs of its occupants. Built to accomodate a family of three, perhaps four, the house can be enlarged easily by adding bedrooms above the first floor, to be reached by stairs built above the present cellar stairs.

It is designed to require a minimum of housekeeping. A compact kitchen is within easy reach of the front door, bedrooms, and dining space in the living room. Ample closets will hold most essentials and a partial cellar has space for screens, awnings and such accessories.

4. It is well-built. Asbestos shingles on the side walls and asphalt shingles on the roof provide fire-resistance and unfading color.

The house is fully insulated with fireproof mineral wool in side walls and above the ceiling. Mineral wool bats, wall-thick, are fitted between the side wall studs and ceiling joists to provide permanent protection against both winter cold and summer heat. Screened vents under the eaves permit ventilation of the attic space.

Withal it is a low-cost house. It can be built in most parts of the country for $5,500, and it will fit on a 40 foot lot.

Expert Advises Culling All 'Counterfeit' Cows

If all the "counterfeit" cows, or animals which do not live up to high standards of efficiency, were sent to the butcher, a surprising improvement in dairy farm income would be noted, says E. J. Perry, extension dairyman at the New Jersey College of Agriculture, Rutgers university. Not only would there be no surplus milk, but there also would be more land to devote to more profitable farm commodities.

"The part that efficient cows play in building dairy farm security cannot be overemphasized," Mr. Perry points out. "It is well known that 18 good cows will yield more profit than 20 average cows, and the 10 will place less milk on the market. For instance, 10 cows averaging 8,000 pounds of milk will produce 80,000 pounds of milk in a year, while 20 cows averaging 5,000 pounds each, will have a total yield of 100,000 pounds. The feed cost for the two kinds of cows will not be very different.

"When several cows of average rating or below are mingling with efficient cows in a herd, the tendency is to keep more cows in order to obtain the income needed. The poor cows eat up some if not all of the profit which the good cows may have made.

Caring for Colt

A little attention given to the feet of colts and young horses may make a difference in the value of the horse when ready to work. When colts' feet are allowed to become uneven and crooked, it is almost sure to affect the feet and legs permanently. Keeping the feet trimmed and shaped up properly allows normal development of the legs and prevents defects in the feet and legs. Poorly shaped feet and crooked legs that have resulted from neglect can be corrected in some measure by proper trimming of the feet.

High-Quality Eggs Bring Good Prices

Consumers who want high quality graded eggs are willing to pay more for them when they have assurance that the eggs really are of high quality, say egg-marketing specialists of the agricultural marketing service.

While the relatively higher prices charged for better eggs might be expected to discourage consumption, just the opposite has been true in states where egg grading programs have been followed.

According to the egg-marketing specialists, consumers of the better grades of eggs appreciate two features of all well-conducted grade-marketing system. They are assured of the superior quality of the better grades, and of the quality that comes with the purchase of a product properly handled from the time it was graded to the time it reaches them.

Population Is Shifting From Cities to Farms

It has been apparent for some time that the population trend is away from the cities and toward the farm. Now the fact seems to be officially proved by the advance tryout in the 1940 federal census. Two counties in Indiana were selected by the government for the preliminary count. The first figures have been released, showing that while St. Joseph county has gained somewhat in its rural areas, the two principal cities, South Bend and Mishawaka, have decreased by a few thousand. The difference was slighter in the case of Marshall county and its county seat, Plymouth. The town gained a little, but the county gained more. These are only two small straws, of course, but they show which way the wind is blowing and the fact is significant after a long period when the "drift to the cities" was regarded as a serious social problem.

Clean Stove Works Wax

Any kind of household equipment works better for being kept clean, uncluged, and uncluttered, and the gas stove is no exception. If spilled foods are permitted to choke up the burners or if the oven walls become coated with grease, the stove cannot be expected to function properly. Daily wiping with a cloth well wrung out of lukewarm soapsuds will keep the enamel surface, inside and outside, spotless. Except for spilled foods, which always should be mopped up at once, it is best to do the washing when the stove cools off. Be sure to remove the broiler racks for frequent soap and water scrubbing or burned foods may discolor the metal permanently. To prevent the top burners from becoming clogged, wash them once a week or so and scrub them with hot soapsuds and soda.

Moose Be Wrong!

Many Indian tribes believed the moose came from the sea . . . and some believed that if the animal were hunted too heavily, he would return to the ocean as a natural refuge . . . which is a perfectly natural belief . . . because, if moose were seen by unreasoning Indians swimming from some distant, unseen island land, it might well be thought to come from the open water.

U. S. Board Ends Dispute Over Naming of Island

A 150-year dispute over the correct name of the island on which the Statue of Liberty stands ended with the announcement by the United States board of geographical names that its correct name is "Bedloe's island."

The New York harbor island has been called "Bedlow island," "Bedloe Island" and "Bedloes island" since it was owned by Isaac Bedloo between 1667 and 1673.

The geographical names board of the interior department decides disputes over names and selects names for places heretofore unnamed.

"Under Secretary Ickes," the announcement on the board's work stated, "the policy of the board has been to avoid officially naming places and objects after living persons so that the christening function cannot be used for political purposes."

Among the 398 decisions handed down in the last year was one concerning a bayou in Louisiana.

The stream, located in Terrebonne parish, should be called "Bayou Colyell," the board decided. It should not be called "Bayou Go-to-Hell."

'RICH' COW FOOD FAILS IN TESTS

High Cost Outweighs the Butterfat Increase.

By KARL E. GARDNER

Can cows be fed something that will make the milk richer? Is there such a feed? Many dairymen have asked these questions, and the practical answer is "no."

At least that's what experiments in the Cornell university department of animal husbandry indicate.

Here is an explanation of what these experiments showed:

At least three feeds are known that will raise the butterfat test slightly. At Cornell's experiments were made with these three: palm kernel oil meal, cocoanut oil meal and ground soybeans.

A feeding of the palm kernel oil meal and cocoanut oil meal at the rate of 20 per cent of the grain ration gave a small rise in test. The increase was less than one-tenth of 1 per cent and thus of small importance.

Ground soybeans fed at the rate of 18 per cent of the dairy grain ration seemed to produce a small increase in fat test. Other experimenters have noted a more definite rise in the fat test when soybeans comprised more than 25 per cent of the grain mixture.

Don't be misled, however. Improvement in test is not great and the cost of these feeds rarely permits their use in proportions necessary to give a practical increase in butterfat.

The economical method of improving the fat test seems to be the same method used for several centuries. This method is selection and breeding. The bull used in the herd is of prime importance, because he influences more offspring than does any other one animal in the herd.

Skim Milk Is Used In Making of 'Wool'

It has long been a wonder to many that when a black cow ate green grass it gave yellow milk, but it's even more of a wonder nowadays when a chemist takes the skim milk and makes wool out of it. The chemists extract the casein, soften it in water, and dissolve the resultant compound in a solution of caustic alkali. It becomes a thick, sticky mass.

After working into the proper consistency by aging and adding other liquids the mixture is forced through a spinneret, hardened, and it is ready to be spun.

The cost of the finished product will be about 50 cents a pound when put on a commercial basis. It may be used in preparing garments for persons allergic to natural wool and for other uses in which natural products have been undesirable.

The lovely lady of spring has been slow in making her appearance.
